```
untisense oligonucleotides for treating hepatitis and colon, liver or lung cancer are inhibitors of Fas, Fas ligand or Fas associated protein (Fap-1) expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents murine Fas (Apo-1). The specification describes artisense compounds which are targeted to the 5'-untranslate region, translational start site, translational termination region or 3'-untranslated region of nucleic acid molecules encoding Fas, Fas ligand (Fast), or Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, Fast or Fap-1 in cells or tissues. They are used to treat autoimmune or inflammatory diseases such as heptitis. They can also be used to treat cancer, especially colon, liver or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PGKKKVEDCKMNGGTPTCAPCTEGKEYMDKNHYADKCRRCTLCDEEHGLEVETNCTLTQN 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                 This sequence represents the mFas antigen used for the mFas.EXT, contained within the plasmid pME185. The soluble Fas antigen is included in the immunoassay kit of the invention. The kit is for the assay of soluble Fas antigen and contains an immobilised anti-soluble Fas monochoral antibody, as well as the standard soluble Fas antigen represented by this sequence. The assay is simple and has high accuracy, high sensitivity, and is capable of assaying a number of different specimens at the same time. The immunoassay is used on biological samples (such as serum) and is useful for diagnosis of autoimmune diseases such as rheumatoid arthritis or systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PGXKKVEDCKMNGGTPTCAPCTEGKEYMDKNHYADKCRRCTLCDEEHGLEVETNCTLTQN 120

                                                                                                                                                                                                                                                                                                                                                                                                    This represents a Fas ligand (FasL) protein. This can be used in the method of the invention of killing of tumour cells which express the Fas receptor. The method comprises administering non-tumourigenic cells that express the FasL to kill the tumour cells. Rhabdomyosarcoma cells which express the Fas receptor can also be killed by administering myoblast cells that express the FasL. The methods can be used for the destruction of Fas receptor expressing tumour cells. They also provide a general immune provocation that stimulates the clearance of the tumour cells involving the infiltration of neutrophils into the area of administration of FasL-expressing cells and also the infiltration of receptor on cells. The methods can also be used for the detection of the Fas receptor on cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antigen is included in the immunoassay kit of the invention. The kit is for the assay of soluble Fas antigen and contains an immobilised anti-soluble Fas monoclonal antibody, as well as one of these standard soluble Fas antigens. The assay is simple and has high accuracy, high sensitivity, and is capable of assaying a number of different specimens at the same time. The immunoassay is used on biological samples (such as serum) and is useful for diagnosis of autoimmune diseases such as rheumatoid arthritis or systemic lupus erythematosus (SLE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PGKKKVEDCKMNGGTPTCAPCTEGKEYMDKNHYADKCRRCTLCDEEHGLEVETNCTLTQN 120

                                                                                                                                                                                            This sequence represents a human tumour necrosis factor receptor-1 which is used in a method resulting in the isolation of a human death domain containing receptor 4, DR4 agonists are used to increase apoptosis induced by tumour necrosis factor (TNF)-family ligands, e.g. in cases of graft vs. host disease, acute or chronic graft rejection, inflammation, DR4 are used to inhibit such apoptosis, e.g. in cases of acquired immune schaemed in the neurodegenerative disease, myelodysplastic syndrome, neurodegenerative disease, myelodysplastic syndrome, anorexia, also a wide range of inflammatory conditions. DR4 of fragments of the protein are used diagnostically, e.g. to detect mutant forms of DR4 (possibly associated with disease), for isolating the DR4 gene or related sequences and for chromosomal mapping.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The Fas antigen is implicated in apoptosis. A cDNA clone encoding the antigen was isolated (PF58) and the amino acid sequence of Fas was deduced from it. The mature protein has a calculated mol.wt. of 36,000 and is a member of the NGFR/TMFR family of cell-surface membrane proteins. The inventors claim a protein comprising at least the extracellular domain of Fas antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding human cell surface antigen - used to clarify apoptosis mechanism of various types of cell, and to prepare monoclonal antibodies that react with tumour cells expressing Fas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            57 QPCQPGKKKVEDCKMNGGTPTCAPCTEGKEYMDKNHYADKCRRCTLCDEEHGLEVETNCT

The plasmid was used in the construction of an expression vector for the prode. of recombinant soluble membrane proteins. The proteins can be used in antibody prodn. for the treatment and prevention of related diseases.

                            A cDNA clone (AAT34526) codes for a membrane receptor-like protein, Fas antigen (AAR9681). It was isolated from cDNA derived from the peripheral blood mononuclear cells of systemic lupus erythematosus (SLE) and angioimmunoblastic lymphadenopathy (ALLD) patients. 4 Soluble variants (AAR99682-85) were identified of the Fas antigen. These arose by alternative splicing of Fas gene transscripts. The Fas variants were present at higher levels in SLE and ALLD patients than the non-soluble Fas antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fas antigen; autoimmune disease; systemic lupus erythematosus; SLE; angioimmunoblastic lymphadenopathy; AILD.

the immunoassay kit of the invention. The kit is for the assay of soluble Fas antigen and contains an immobilised anti-soluble Fas monoclonal antibody, as well as the standard soluble Fas antigen represented by this sequence. The assay is simple and has high accuracy, high sensitivity, and is capable of assaying a number of different specimens at the same time. The immunoassay is used on biological samples (such as serum) and is useful for diagnosis of autoimmune diseases such as rheumatoid arthritis or systemic lupus erythematosus
                                                                                                                                                                                                                                                                                                            117 LTQNTKCKCKPDFYCDSPGCEHCVRCASCEHGTLEPCTATSNTNCRKQSPRNRLWLLTIL 176

The present sequence represents a Fas protein sequence used in the method of the invention. The method is concerned with reducing depictation of activated Fas-expressing CD8+ T-Iymphocyte Killer (TK) cells in an immune cell population which also comprises of Fas-ligand cells in an immune cell population which also comprises of Fas-ligand immune cell population which well as agent (e.g. a soluble Fas-Fc fusion protein) which would interfere with the interaction between Fas and FasL. Therefore, the method is useful for interaction between Fas and FasL. Therefore, the method is useful for identifying suitable agents which can reduce depletion of activated CG Fas-expressing CD8+ TK cells in immune cell populations. Also claimed is the use of the agent in the manufacture of therapeutic compositions. Associally surface receptor Fas and its ligand FasL. By interfering with this interaction, the method described and its preparations can prevent apoptosis of CD8+ TK lymphocytes caused by expression of FasL on activated CD4+ cells. Such FasL-expressing activated CD4+ cells are especially the result of CD4+ cell infection with an immunodeficiency virus e.g. human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). The claimed prevention of apoptosis and the CD4+ cells infected with the infectious agent, enabling treatment (prophylactic and/or therapeutic) of immunodeficiency is a firement of the company than allow the company company company companies of the company companies of the compa

                                                                                                                                                                                                Fas antigen derivative containing modified extracellular region -
has low antigenicity, promotes apoptosis and is useful in treatment
of viral and other diseases
                                                                                                                                                                                                                                                                                                                                                                          antigen derivatives, which contain a Fas antigen extracellular region lacking one or more amino acid residues in the region from the amino-terminal to (but excluding) the lst cysteine residue (preferably at least 29 residues are deleted).

The derivatives are effective regulators of apoptosis and can be used (either by administration of the polypeptide, or by the use of the coding DNA in gene therapy) to treat a range of diseases, such as hepatitis, influenza and HIV, by modulating apoptosis of virus-infected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        233 TIQEAKKFARENNIKEGKIDEIMHDSIQDTAEQKVQLLLCWYQSHGKSDAYQDLIKGLKK

Lumior necrosis factor receptor 1 precursor [validated] - human

NyAlternate names: P55 tumor necrosis factor receptor; TNF receptor type 1

NyContains: tumor necrosis factor alpha inhibitor; tumor necrosis factor binding proC; Species: Homo saplens (man)

C; Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 08-Dec-2000

C; Accession: A38208; A34899; A34900; A36555; C36555; A38201; S12057; JT0758; A60231;

Genomics 13, Z19-224, 1992

DNA Cell Biol. 9 705-715, 1990

A; Title: Molecular cloning and expression of human and rat tumor necrosis factor receptc

A; Reference number: A36555; MUD:91090841; PMID:1702293

A; Molecule type: mRNA

A; Residues: 1-461 < HINA

A; Cross-references: GB:M63122; NID:9207361; PIDN:AAA42256.1; PID:9207362

C; Comment: This protein is one of two known receptors for both TNF-alpha (cachectin) and C; Superfamily: tumor necrosis factor receptor; transmembrane protein
